## Simplified Schematic

The ZX76-31-PN(+) parallel interface consists of 5 control bits that select the desired attenuation state, as shown in Table 1: Truth Table

**Table 1. Truth Table**

Attenuation State	C16	C8	C4	C2	C1
Reference	0	0	0	0	0
1 (dB)	0	0	0	0	1
2 (dB)	0	0	0	1	0
4 (dB)	0	0	1	0	0
8 (dB)	0	1	0	0	0
16 (dB)	1	0	0	0	0
31 (dB)	1	1	1	1	1

Note: Not all 32 possible combinations of C1 - C16 are shown in table

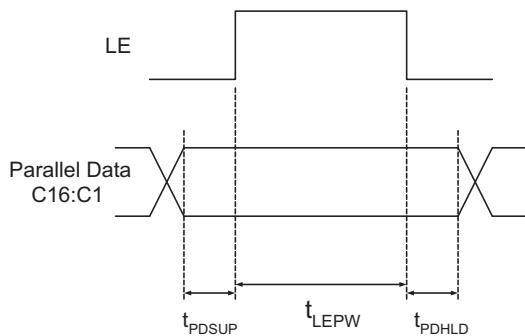

The parallel interface timing requirements are defined by Figure 1 (Parallel Interface Timing Diagram) and Table 2 (Parallel Interface AC Characteristics), and switching speed.

For latched parallel programming the Latch Enable (LE) should be held LOW while changing attenuation state control values, then pulse LE HIGH to LOW (per Figure 1) to latch new attenuation state into device.

For direct parallel programming, the Latch Enable (LE) line should be pulled HIGH. Changing attenuation state control values will change device state to new attenuation. Direct mode is ideal for manual control of the device (using hardwire, switches, or jumpers).

Control cables for programming and CD with software can be ordered separately. For details see page 9.

**Figure 1: Parallel Interface Timing Diagram**

**Table 2. Parallel Interface AC Characteristics**

Symbol	Parameter	Min.	Units
$t_{LEPW}$	LE minimum pulse width	10	ns
$t_{PDSUP}$	Data set-up time before clock rising edge of LE	10	ns
$t_{PDHLD}$	Data hold time after clock falling edge of LE	10	ns

## Power-up State

When the attenuator powers up and LE is logic low, the nominal attenuation is set on 0 dB. When LE is logic high, the nominal attenuation selected upon control logics ( see Table 1 ).
